

Weekly Report

- **Title:** Fortnightly Training Report
- **Student Name:** Reem Fahad Alharthi
- **Student ID:** 445002604
- **Program:** Bachelor of Computer Science
- **Week:** Week 1 and Week 2
- **Dates:** 18 Jan to 29 Jan 2026
- **Organization/Company Name:** Wadi Makkah Technology Company
- **Supervisor Name:** Mr. Khalid Abdulghani
- **Submission Date:** 2 Feb 2026

1. Introduction

This report aims to document the tasks and activities carried out during the first and second weeks of the cooperative training period, in accordance with the approved training plan. This phase focused on introducing the training environment, strengthening fundamental programming concepts, learning version control tools and teamwork practices, and applying practical skills in web development.

2. Tasks and Responsibilities

Week 1:

- Participated in the training orientation program and became familiar with the training objectives and requirements according to the approved plan.
- Studied the concept of programming functions and their construction, explaining how they evolve from a basic idea into reusable functions, through a practical example using the length function in Java.
- Converted pseudocode into Java code to enhance understanding of programming logic and code structure.
- Designed and implemented a frontend interface that simulates an existing website.

- The result was evaluated by the supervisor with a high similarity rate, reflecting accuracy in implementation and understanding of transforming designs into code.
- Utilized the Bootstrap and Tailwind CSS frameworks in frontend development.

Week 2:

- Set up and configured development environments and installed the appropriate versions of Java, JavaScript, and Python.
 - Learned the basics of Git and used Git Bash and GitHub to manage versions and track code changes.
 - Developed a frontend interface as part of a team project to apply teamwork concepts and use GitHub for project management.
-

3. Skills and Knowledge Gained

- Gained a deeper understanding of how built-in functions work and how they are implemented in Java.
 - Improved the ability to convert pseudocode into functional code.
 - Acquired practical experience in frontend development using Bootstrap and Tailwind CSS.
 - Learned the fundamentals of version control using Git and GitHub.
 - Enhanced teamwork and coordination skills within a programming team.
-

4. Challenges Faced

Some challenges were encountered in configuring development environments and ensuring compatibility between different programming language versions. In addition, there were initial difficulties in understanding how Git and GitHub work, particularly in managing versions and handling shared repositories, as this was a new experience with version control systems.

5. Solutions and Improvements

These challenges were addressed by following the provided guidelines and ensuring the installation of appropriate versions for each programming language. Difficulties related to Git and GitHub were overcome through direct guidance from the supervisor, along with self-learning through a basic Git course, which improved understanding of version management and collaboration on shared repositories.

6. Conclusion

The first two weeks of cooperative training contributed significantly to building a solid foundation in programming concepts and frontend web development, as well as gaining familiarity with a professional work environment and version control tools. Practical application and teamwork further enhanced technical understanding. Despite initial challenges in environment setup and using Git and GitHub, these issues were successfully overcome through guidance and self-learning, leading to improved performance and readiness for more advanced training tasks in the upcoming period.
