

Weekly Report

- **Title:** Fortnightly Training Report
- **Student Name:** Reem Fahad Alharthi
- **Student ID:** 445002604
- **Program:** Bachelor of Computer Science
- **Week:** Week 5 and Week 6
- **Dates:** 15 Feb to 26 Feb 2026
- **Organization/Company Name:** Wadi Makkah Technology Company
- **Supervisor Name:** Mr. Khalid Abdulghani
- **Submission Date:** 27 Feb 2026

1. Introduction

This report aims to document the tasks completed during the fifth and sixth weeks of the cooperative training period. No new development tasks were assigned during this time; therefore, the period was utilized to review the technical aspects of previous projects and to strengthen my understanding of building APIs using Node.js and Express.js. In addition, I reviewed React concepts and improved the integration between the frontend and backend. A benchmarking study was also conducted on an international testing platform to analyse its structure and operational mechanisms.

2. Tasks and Responsibilities

Week 5:

- **Benchmark Study – Pearson VUE Platform:** I conducted a benchmarking study on Pearson VUE to understand how professional online examination systems operate. I focused on analyzing the user experience, exam scheduling process, result display methods, and security and identity verification mechanisms. This study helped me understand the standards followed by international platforms and benefit from them when developing similar ideas.

Week 6:

- **API Review:** I reviewed the API that had been previously developed using Node.js and Express.js. I ensured that the routes were properly organized and tested all requests (GET, POST, PUT, DELETE). I also checked the error handling process and verified that responses were correctly returned in JSON format. This review strengthened my understanding of backend development concepts.
 - **React Review and Code Improvement:** I revised the fundamental concepts of React, including components, state management, and the use of props, as well as integrating the frontend with the API using fetch. I also reorganized the project files and improved the code structure to make it clearer and easier to maintain in the future.
 - **Frontend and Backend Integration Testing:** Systematic testing was conducted to ensure proper communication between the frontend built with React and the backend developed using Node.js and Express.js. The request-response cycle was carefully monitored, technical issues were debugged, and real-time data updates were verified. This process improved system stability and strengthened my understanding of full-stack application architecture.
-

3. Skills and Knowledge Gained

- Analyzing professional systems through a benchmarking study of the Pearson VUE platform.
 - Understanding basic test security and integrity, including identity verification and live proctoring.
 - Analyzing user experience (UX) in sensitive systems such as professional testing platforms.
 - Developing analytical thinking and evaluating technical systems according to clear standards.
-

4. Challenges Faced

- One of the main challenges was documenting the report using the actual dashboards of the Pearson VUE platform, as most of the technical and administrative information of the platform is not publicly available. This made accessing data related to user experience, security procedures, and monitoring the test processes difficult. Additionally, the platform contains multiple levels of data and functionalities, and there was no clear guide on how to access and organize this information for use in the report.
-

5. Solutions and Improvements

- By researching the official Pearson VUE website, I found illustrative videos and simulation models showing the test procedures, security measures, exam monitoring, and system integration. I used these resources to identify the most important information that could be converted into dashboards, such as the steps of the user experience, identity verification procedures, and the overall workflow of the system.
-

6. Conclusion

During these two weeks, I had a hands-on experience analyzing professional systems like the Pearson VUE platform. I faced real challenges in understanding how security procedures, user experience, and system integration work, but by exploring the official website and studying simulation videos, I was able to see the bigger picture. This experience allowed me to enhance my technical skills, understand how to turn complex information into practical insights, and made learning from challenges a natural part of my daily work.

End of Report
