

Weekly Report

- **Title:** Fortnightly Training Report
- **Student Name:** Reem Fahad Alharthi
- **Student ID:** 445002604
- **Program:** Bachelor of Computer Science
- **Week:** Week 11 and Week 12
- **Dates:** 12 Apr to 23 Apr 2026
- **Organization/Company Name:** Wadi Makkah Technology Company
- **Supervisor Name:** Mr. Khalid Abdulghani
- **Submission Date:** 24 Apr 2026

1. Introduction

This report summarizes the tasks completed during the eleventh and twelfth weeks of the cooperative training, focusing on the Soft Landing platform project. The work involved analyzing and designing a digital system by understanding its structure and organizing its requirements based on the PRD. These requirements were translated into technical models such as database design (ERD), system workflows, and user flows. In addition, functional requirements were analyzed, and low-fidelity wireframes were developed to define interface structure before implementation. Overall, this experience enhanced the understanding of the system development lifecycle and the connection between technical design and user experience.

2. Tasks and Responsibilities

Week 11:

Intersect OS Project – Soft Landing Platform

- **System Analysis and Design**

During this week, the Soft-Landing Platform was analysed and designed. This platform is a digital system aimed at enabling foreign companies to enter the Saudi market in a structured and step-by-step manner. The work began by reviewing the project requirements (PRD) and translating them into a technical design, including the database design (ERD) and the system sitemap.

Based on the PRD, three main user roles were identified within the system: Platform Admin, Platform User, and Client User. The Platform Admin has full control over the system, including managing users and companies, controlling system rules, and issuing licenses. The Platform User is responsible for reviewing applications and documents, ensuring their completeness, and requesting modifications when necessary. The Client User represents the company and is responsible for entering company data, uploading required documents, and tracking progress. To ensure proper access control, the Role-Based Access Control (RBAC) model was implemented to define permissions clearly and restrict unauthorized access.

In addition, the system workflow was designed to reflect a clear and structured process. The process begins with the client user submitting company information and uploading the required documents. The request is then reviewed by the platform user to verify its completeness and accuracy. If any information is missing, the request is returned to the client for modification. Once the request is complete, it is forwarded to the admin for final decision-making. Accordingly, the request is either approved or rejected, and its status is updated within the system.

Regarding the database design, an Entity-Relationship Diagram (ERD) was developed to illustrate the relationships between the core entities of the system, including User, Company, Stages, Documents, and Licenses. These entities are interconnected in a way that reflects the flow of data and the user's progress throughout the system. Furthermore, a Rule-Based System, known as the Market Entry Engine, was implemented to determine the required stages, documents, and licenses for each company based on its type and sector, with flexibility for admin control.

- **User Flows Design**

A set of user flows was designed to illustrate the user journey within the system for each role, using flowcharts

The Client User Flow represents the company's journey within the system. It begins with the user logging in and entering company information, followed by displaying the required stages and tasks. The user then completes the tasks and uploads the necessary documents before submitting the request and tracking its status through the dashboard. In case of rejection, the user receives a notification requesting modifications or missing information. In case of approval, the progress percentage is updated, and the user proceeds to the next stage. This process continues iteratively until all stages are completed and the final license is issued.

The Platform User Flow represents the role of the platform employee, who is responsible for reviewing company applications, validating data and documents, requesting modifications when necessary, and updating the request status. Once the review process is completed, the request is either forwarded to the admin for final approval or returned to the client if it is incomplete.

The Platform Admin Flow represents the full supervisory role within the system. The admin is responsible for managing users and companies, modifying stages for each sector, controlling Market Entry rules, making final decisions regarding requests (approval or rejection), and issuing licenses. Additionally, the admin oversees the overall workflow to ensure alignment with system requirements.

- **Functional Requirements Analysis:** during this task, the functional requirements of the system were analyzed and documented based on the project requirements document (PRD). The main system functionalities were identified to ensure that the platform meets its objectives and supports the needs of different user roles.

This included defining features such as authentication and account management, company profile management, and the logic for determining required stages and tasks through the Market Entry Engine. In addition, dashboard functionalities were specified to display progress percentage, request status, and system stages, along with a progress tracking mechanism based on task completion.

Document management requirements were also defined, including file uploads, linking documents to specific stages and requests, and the ability to request resubmission when necessary. Furthermore, a notification system was specified to inform users of any updates or changes related to their requests.

All these functionalities were aligned with the different user roles in the system, with the implementation of Role-Based Access Control (RBAC) to ensure proper access and permission management.

Week 12:

- **Wireframe Design:** during this task, low-fidelity wireframes were created to define the overall structure and layout of the system interfaces based on the project requirements document (PRD). The main objective was to establish a clear and logical organization of content before moving to the visual design and development phases.

This included dividing the interfaces into clearly defined sections such as the header, page title, content areas, and action buttons, with each section designed as an independent container to ensure clarity and ease of implementation. In addition, emphasis was placed on organizing input fields and grouping related information in a logical manner to enhance usability.

Consistency across the system was maintained by applying a fixed structure and avoiding unnecessary merging of components, which contributed to improving user experience and reducing complexity. Furthermore, interactive elements such as forms, document upload areas, and control buttons were clearly positioned within each interface.

The wireframes were also aligned with system functionalities and different user roles to ensure that all required interactions are logically placed and easily accessible.

Overall, this task provided a clear structural foundation for the system, reducing design ambiguity and facilitating a smooth transition to the UI design and development stages.

- **Visual Identity Design:** during this task, a comprehensive visual identity was developed to establish a consistent and professional appearance for the system, reflecting the Soft-Landing platform's brand and enhancing the overall user experience. The design focused on selecting a cohesive color palette, appropriate typography, and well-structured UI styling aligned with the platform's objectives. This included defining primary and secondary colors, designing background styles, and developing key visual elements, while ensuring proper contrast and readability across all interfaces.

In addition, a complete Brand Guidelines document was prepared to serve as a unified reference for all design elements, ensuring consistency across different interfaces and media. This guide includes the logo, color palette, and typography, along with clear usage guidelines that reflect the platform's professionalism and strengthen its visual identity.

3. Skills and Knowledge Gained

- Developed the ability to analyze system requirements based on the PRD.
 - Gained the ability to translate requirements into technical models such as ERD and system workflows.
 - Acquired skills in defining user roles and permissions (RBAC).
 - Learned how to document functional requirements in a clear and structured manner.
 - Developed the ability to design user flows.
 - Gained experience in designing low-fidelity wireframes.
 - Improved the ability to organize UI elements in a logical way.
-

4. Challenges Faced

During the wireframe design phase, I faced difficulties in organizing UI elements in a clear and structured manner. It was challenging to determine the appropriate layout for each screen while ensuring that all required information and functionalities were presented without clutter or complexity. I also encountered difficulties in maintaining consistency across different screens, especially with multiple user roles, each having different needs and interactions within the system. In addition, aligning the wireframe design with the system's functional requirements was challenging, particularly in placing interactive elements such as input fields, forms, document uploads, and navigation flows in a logical and user-friendly way.

5. Solutions and Improvements

To address this challenge, a consistent design structure was applied across all screens by dividing each interface into clear sections such as the header, content areas, and interactive elements. UI elements were organized based on a logical flow that reflects the user's journey within the system, which helped reduce complexity and improve clarity. In addition, the design was continuously reviewed and refined through iterative improvements to ensure consistency across different screens and alignment with functional requirements and user roles, resulting in a more intuitive and user-friendly interface.

6. Conclusion

In conclusion, the eleventh and twelfth weeks of cooperative training significantly enhanced my skills in system analysis and design. The experience went beyond completing tasks, as it provided a deeper understanding of how digital systems are structured and transformed into technical models.

Throughout this period, working on system analysis, user flows, functional requirements, and wireframes helped me connect theoretical knowledge with practical application and better understand how system components and user roles influence design decisions.

This experience also strengthened my analytical thinking and attention to detail, while highlighting the importance of structured documentation and user-centered design. Overall, it provided a strong foundation in system development and prepared me to approach future projects with greater confidence and professionalism.

End of Report
